#### ABSTRACT

The data presented in this article are related to the research article described by “How can the role of leachate on nitrate concentration and groundwater quality be clarified? An approach for landfills in operation (Southern Italy)” (Cossu et al., 2018).

The data set for this article contains chemical analyses of groundwater and leachate, isotope analysis of groundwater and leachate around a group of landfills located in the municipality of Conversano, close to Bari, the main town of the Apulia Region (Southern Italy).

Groundwater samples were collected from eighteen wells.

The hydrogeological and chemical study was used to define geochemical features, groundwater and leachate characteristics and to study their potential macroscopic mixing.

The land use analysis highlighted quantity and type of used fertilizers permitting to compare these with groundwater in terms of isotopic signature.

### Specifications table

Subject area	<i>Earth and Planetary Science</i>
More specific subject area	<i>Environmental Science, hydrogeology, geochemistry, isotopic</i>
Type of data	<i>Table, figure</i>
How data was acquired	<i>pH, EC, T, TDS, Eh, and DO (multi-parametric probe Quanta G Hydrolab model); Li<sup>+</sup>, Ca<sup>2+</sup>, Mg<sup>2+</sup>, K, Na, Fe and Mn (ICP-OES spectrometry); F<sup>-</sup>, Cl<sup>-</sup>, SO<sub>4</sub><sup>2-</sup>, NO<sub>3</sub><sup>-</sup> and NH<sub>4</sub><sup>+</sup> (ion chromatography); <sup>3</sup>H (liquid scintillation counting, Perkin Elmer Quantulus GCT 6220 Liquid Scintillation Analyzer); Water-level tape, subcentimeter graduated; Standard rain and temperature gauge;</i>
Data format	<i>Analyzed.</i>
Experimental factors	<i>Sampling procedures included: 1) measuring in the field of EC, T, pH, TDS, Eh, and DO; 2) assessing the alkalinity in the field, by means of titration with HCl; 3) acidifying samples for cation analysis by the addition of HNO<sub>3</sub> to a pH &lt; 2. Water samples for metals determination was not filtered but was acidified before chemical analysis. This choice was due to the scope to explain some anomalously high iron contents that were detected in previous determinations in the area. Water sampling and storing <sup>3</sup>H determinations do not require any specific pre-treatment.</i>
Experimental features	<i>Determination of physical, chemical and isotopic parameters with the purpose to clarify the role of landfill leakage on groundwater quality degradation.</i>
Data source location	<i>Conversano, Italy</i>
Data accessibility	<i>Data are available in the article</i>

### Value of the data

- The data could be used to determine groundwater quality and the level of chemical contamination due to a group of landfills.
- The data clarify the lack of landfill role in the case of nitrate groundwater quality degradation, highlighting the role of fertilizers.
- The data could be helpful for concerned authorities and policy makers in water quality management.

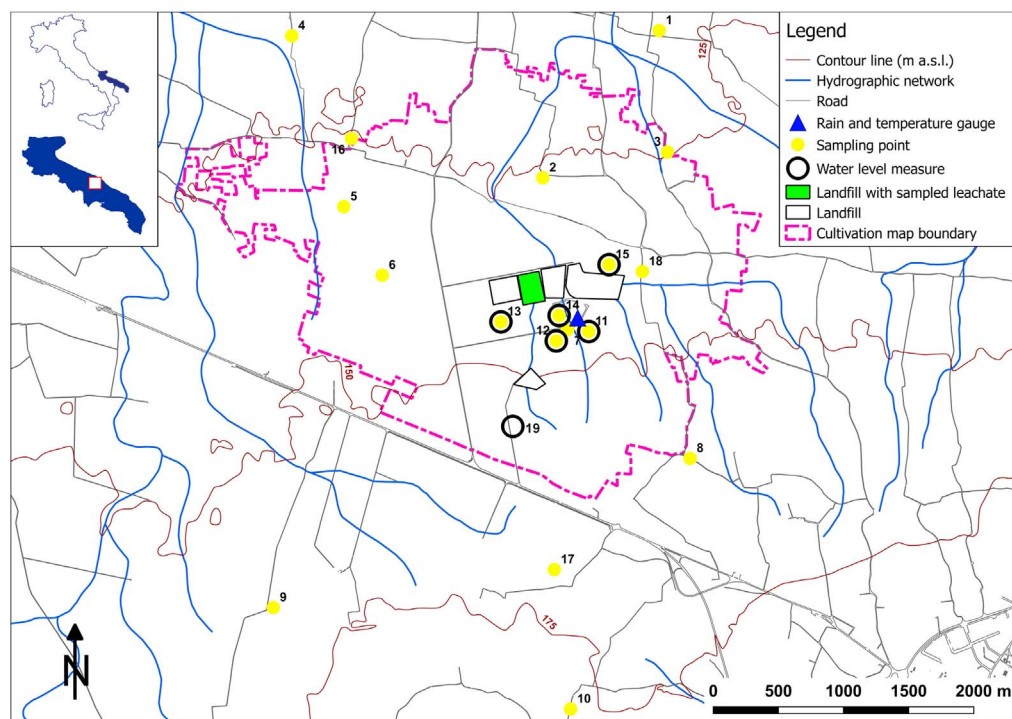

### 1. Data

The whole research experience is described by Cossu et al. [1]; in these context, the authors of this paper managed the whole set of on-site measurements and/or sampling. The data contains geochemical and isotopic analysis of groundwater samples collected in eighteen (18) wells (Table 1) located close to a group of landfills and the leachate of one landfill (Fig. 1). Surveys were realized during November 2014 (Fig. 1 and Table 2), March (Fig. 2 and Table 3) and June 2015 (Fig. 3 and Table 4).

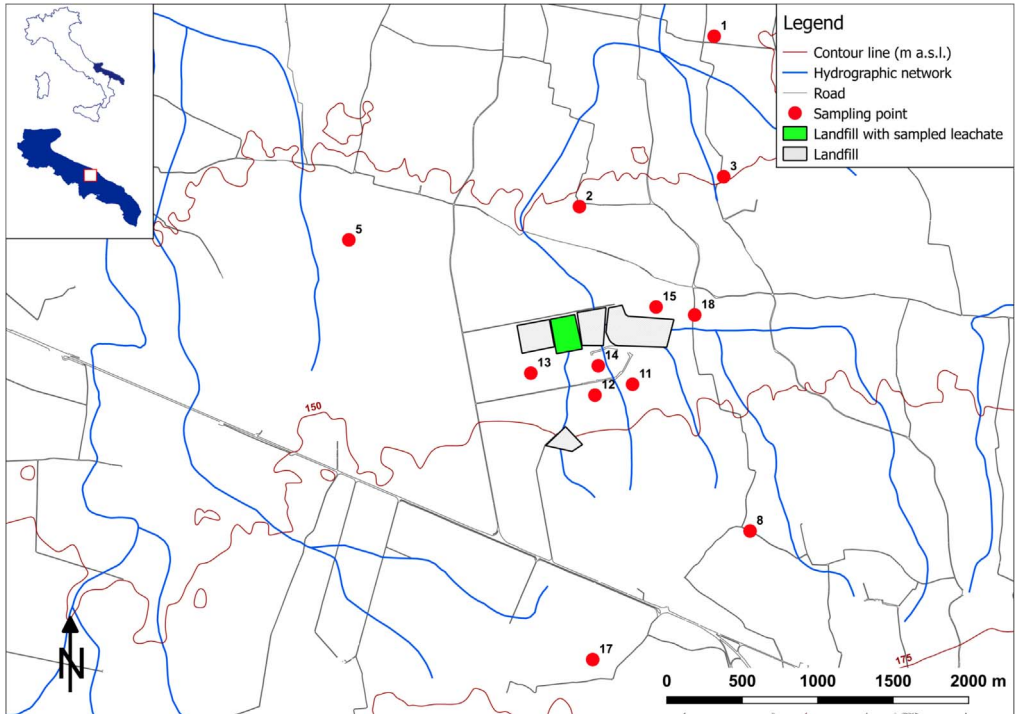

Fig. 2. Survey map: survey II, sampling of March 2015 (Table 3); cultivation map boundary (Table 5).

The data contains the land use analysis and the estimation of nitrogen contributions deriving from fertilizers.

The landfill group is located in the municipality of Conversano, close to Bari, the main town in the Apulia region, South Italy. Table 1 shows the sampling point used in this study. The study area is located in the largest coastal and karstic aquifer of Italy [2,3], widespread hit by seawater intrusion effects [4].

## 2. Materials and methods

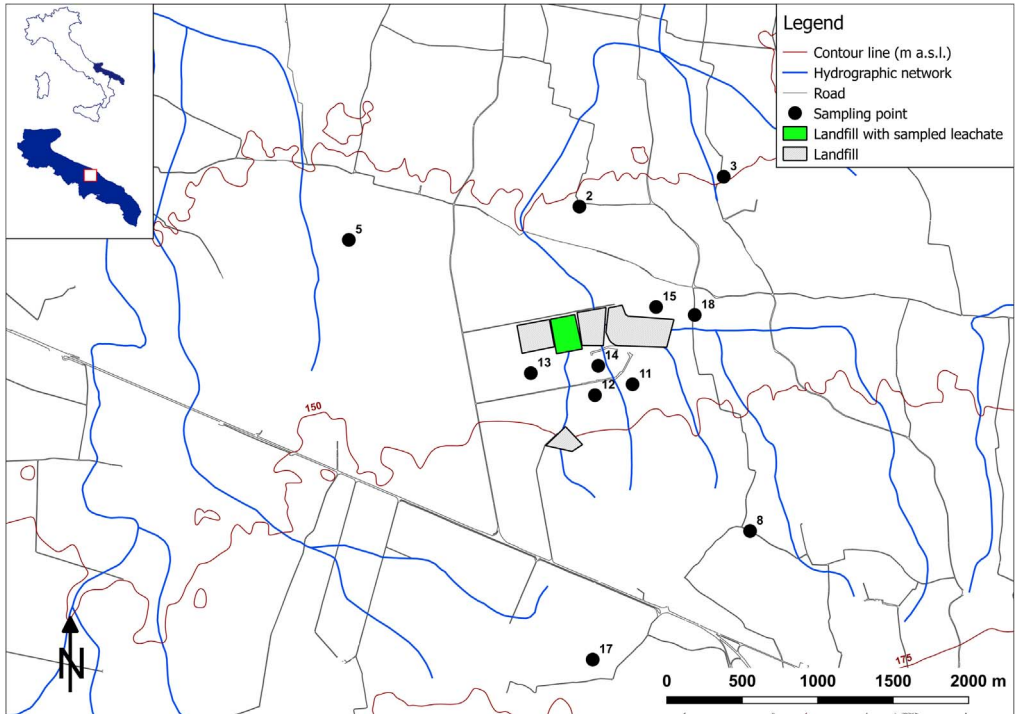

The pH, Electrical Conductivity (EC), Temperature (T), Redox Potential (Eh), and dissolved oxygen (DO) were measured in the field by means of a multiparametric probe (Tables 2–4). The total alkalinity was determined by titration with 0.1 N HCl to a pH of 4.5. Samples for cation analysis were preserved by the addition of HNO<sub>3</sub> to a pH < 2.

Water samples for metals determination was not filtered but was acidified before chemical analysis. This choice was due to the scope to explain some anomalously high iron contents that were detected in previous determinations in the area. The latter fraction was filtered to tap suspended particles from filters to be studied with the scanning electron microscopy. The scope of both fractions was to verify if they can explain a dissolved metal enrichment in the case of sampling without

**Fig. 3.** Survey map: survey III, sampling of June 2015 (Table 4); cultivation map boundary (Table 5).

filtering before acidifying.

Water chemistry analyses were carried out at the chemical laboratory of DiSSPA. Anions ( $F^-$ ,  $Cl^-$ ,  $NO_3^-$ ,  $SO_4^{2-}$ ) and ammonium ion ( $NH_4^+$ ) were analyzed by ion chromatography, while  $Li^+$ ,  $K^+$ ,  $Na^+$ ,  $Ca^{2+}$ ,  $Mg^{2+}$ , Fe and Mn by means of ICP-OES spectrometry (Tables 2–4).

The charge balance errors for the analyses was mandatory within 5%.

The multi-isotope characterization of groundwater and leachate was focused on  $\delta^{18}O$ ,  $\delta^2H$ ,  $^3H$ ,  $\delta^{13}C$ ,  $\delta^{15}N-NO_3^-$  and  $\delta^{18}O-NO_3^-$  [1].

It could be suggested a refrigerated storing of the polyethylene bottles of tritium ( $^3H$ ) water samples until the laboratory analysis starts.

Groundwater and leachate  $^3H$  level was determined at the Hydroisotop Schweitenkirchen GmbH Laboratory (Germany), by liquid scintillation counting (LSC), preceded by electrolytic enrichment. Due to the low level of tritium in groundwater, each groundwater sample was subjected to an electrolytic enrichment process before the measurement (Tables 2–4).

The land use analysis pursues the characterization of nitrogenous sources due to fertilizer use, working on remote sensing maps, refined by on site GPS observations, and technical interviews (Fig. 4). On this basis, it is possible to recognize cultivation (Table 5), acquiring data on fertilizer loads.

Rainfall and temperature data were automatically stored using a gauge installed inside the study area (Fig. 1, Table 6).

**Fig. 4.** Map of main cultivation types close to landfills. Legend: 1) Orchard; 2) Arable; 3) Olive groves; 4) Vineyard; 5) Other; 6) Landfill. Cultivation areas are in Table 5.

**Table 5**

Main cultivation types and areas close to the group of landfills (Fig. 4). Total area 7.86 km<sup>2</sup>.

	Crops	Area (km <sup>2</sup> )	Area (%)
1	Orchard	0.51	6.49
2	Arable	1.56	19.85
3	Olive groves	2.10	26.72
4	Vineyard	3.40	43.26
5	Other	0.29	3.38

**Table 6**

Monthly rainfall and air temperature measurements. (\*) Due to seven days of data missing, monthly values of December 2014 were estimated using the closest regional gauge (distance 4.5 km).

Year	Jan.	Feb.	March	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
Rain (mm)												
2014	30.6	27.2	23.8	103.2	54.0	84.2	100.2	8.6	64.2	66.2	50.0	38.6*
2015	108.0	71.6	115.0	25.8	41.2	45.0	0.0	1.4	44.8	101.2	78.2	9.2
Temperature (°C)												
2014	8.8	9.8	9.9	12.3	15.4	20.3	21.7	23.0	18.5	15.3	13.0	9.4*
2015	6.8	6.6	8.9	12.0	17.6	20.3	24.6	23.1	20.2	14.8	10.1	7.2

**Table 7**

Piezometric survey (Nov. 15, 2016), measurements of piezometric depth below ground altitude (Table 1).

Well	Depth to piezometric level (m)
11	126.78
12	124.04
13	121.73
14	121.28
15	120.47
19	137.20

Using a water-level tape, piezometric depth measurements were realized in some wells, where it was possible to remove pumps and pumping tubes (Table 7).
